

**RESTRICTING COMMUNICATION OF SELECTED PROCESSES TO A
SET OF SPECIFIC NETWORK ADDRESSES
ABSTRACT OF THE DISCLOSURE**

5 Selected processes are associated with sets of specific network addresses, and the
associations are stored. When a selected process creates a child process, an association
between the child process and the set of network addresses with which the parent process
is associated is stored. When a selected process is deleted, the association between the
selected process and its set of network addresses is deleted. Each selected process is
10 restricted to network address-based communication via its associated set of network
addresses. Certain communication protocol subroutines associated with network address-
based communication are intercepted by an interception module. The interception
module detects attempts by selected processes to communicate via network addresses. If
a selected process attempts to communicate via an unassociated network addresses, the
15 attempted communication is prohibited.
